

Eido startup test plan report

Account Handling

1. We can successfully create an account on the mobile application but the web application doesn't redirect us upon successful account creation to the onboarding process. We can thus skip entirely this process (which lets us bypass the mail verification system).
2. Cannot test this scenario as I don't meet the prerequisites (my Google account has its OAuth2 feature disabled)
3. Works fine
4. Cannot test this scenario
5. Account deletion seems fine
6. We can edit every information but on the Web Application the type "Autre" doesn't seem to appear
7. We can successfully edit our email address
8. The password reset procedure seems to be available.
9. We can log-out successfully

Lessons importation and support generation

1. I can verify that the import from pdf system is working, but it cannot accept pdf using the drag-and-drop method. The system will also not accept password lock files.
2. Support generation using photos seems to be working but tends to analyze the keyboard also if the photo is taken of a laptop.
3. The creation from scratch is working fine

Support edition

1. Support edition has changing behavior depending on the platform (web app seems to stop parsing when finding a markdown formatted url)
2. Same as above

Support usage

1. Focus mode is working but is missing a tutorial on how to exit it.
2. Working as intended
3. Working as intended

Support library

1. Working as intended
2. Folders are working but limits need to be applied (no max name length or number of nested folders, UI seems to break after 18 nested folders)
3. Folder creation is working
4. Folder update is working
5. Deletion of folder and its content are working

Revision program

1. Objectives are created and displayed
2. We can update an objective as intended
3. Objectives deletion is working as intended
4. Session's completion is working but nothing happens when the goal is reached

Others

1. OCR Detection can hallucinate the subject when the given file is empty or without any text.
2. The notification toggle activates even if I refuse the iOS popup to allow it
3. IOS system notification are sent in English regardless of the system language
4. Date Picker close itself after choosing one field
5. Application is in a buggy state when the network connection is removed at startup or during library browsing
6. The keyboard in the editor hides text
7. No dark mode component for the markdown citations
8. No error page if the fetch entity doesn't exist (invalid UUID)
